

## MAC LESSON #28

### FINDING AUTOMATED FUNCTIONS IN OS X

I've always thought it would be nice to automate things on my Mac, and I found a place where some automation is hidden and you have to dig for it. Here's what to do.

Double-click the hard drive icon on the desktop then open the Applications folder. Now open the AppleScript folder. Now double-click on the AppleScript Utility icon, and in the resulting dialog box, turn on the show Script Menu in Menu Bar checkbox. Close the Utility dialog, and then go to the menu bar at the top of your screen and click on the new Script icon, usually located at the top right. A list of all sorts of cool automatic functions is now just a click away. Isn't that cool?
