

MAC LESSON #43

WIDGET WATCHES TIME WORLDWIDE

if you need to know the time in more than one place at a time, you're in luck. Just use the Click widget. It's easy.

Move your mouse pointer over the click face and then you'll see a very small letter i in the lower right corner. Click on the i and the Widget will rotate and display its backside. There, you will see the default continent and city. Change them to see the local time for the selection you made.

You can drag multiple copies of the clock to your Dashboard and set each one to a different place. Now you'll see the correct time in each of the places you selected. Not bad!
