

MAC LESSON #105

OS X FAST SHUT DOWN

In my PC Lessons, I showed you how to shut your Windows XP PC down with three keystrokes. You'd press and release the Windows key and then tap the letter U twice.

Well it's even better in OS X. You just press and release the Power button and then press the Return key. It's that easy.

When you press and release the Power button a window opens that gives you the choice of Shut Down, Restart, or enter Sleep Mode. Since Shut Down is the default mode and is highlighted, pressing and releasing the power button and then pressing the Return key (the Enter key on a PC) is the fast shut down for the Mac.
